

# SNR Linear Motion : Ball screws

## A global manufacturer of bearings.

For almost a century, SNR has designed, developed and manufactured bearings to meet the most demanding of applications. In April 2008, SNR and the Japanese Group NTN joined forces.

As one of the 3 largest companies in the manufacture of bearings, our group offers its customers added value in terms of service, quality and products.

The NTN-SNR Group is distinguished by its global presence and by its company-wide quality assurance system.

We have been active in linear ball rail systems since 1985 and our complete range, based on innovative, high-quality products, has developed significantly.

Today, we can offer a solution for a vast range of applications that need linear motion systems.

This catalogue aims to help you discover our new standard range of ball screw products in rolled and ground versions.

The large range of nuts, options for custom machining and our extensive technical knowledge enable us to design and propose custom-made solutions for our customers.

Ball rail systems find applications in a diverse range of industries such as machine tools for metal, wood, plastic, specialist machinery, aeronautics, automated assembly lines and semi-conductor industries.

Our technical department draws on many years of experience in all these areas and is available to help you develop solutions suited to your needs.

With that in mind, this technical documentation was designed as a basis for dialogue. Our technical and sales engineers will provide you with any technical information you may require.

- R: Rolled, right-hand thread
- L: Rolled, left-hand thread
- Available from stock
- Available from ex stock
- Not a standard programme, request through project

## Special programme whirled or polished

<b>Whirled:</b>	Tolerance classes T7, T5
<b>Ground:</b>	Tolerance classes T5, T3, T1
<b>Models:</b>	Metric and inch
<b>Diameter:</b>	From 6 mm to 125 mm
<b>Pitch:</b>	From 1 mm to 50 mm
<b>Nut variants:</b>	With flange according to DIN/ISO Cylindrical With thread socket Miniature Special models
<b>Preload:</b>	Max 5% of dynamic load rating (single nut) Max 10% of dynamic load rating (double nut)
<b>Materials:</b>	Spindles Cf53, X90CrMoV5 (rust-proof e.g. for application in medical technology) Nuts 16MnCr5, rust-free models are possible Balls 100Cr6, X45Cr13 (rust-resistant) ceramic balls

**Wiper:** PTFE wipers, brush wipers, felt wipers etc.

ATC coating e.g. for use in corrosive media, food industry.

The ATC coating consists of more than 98% pure chromium. It is an extremely hard, crack-free, dome-shaped, precise, very thin and highly pure chromium coating.

# Standard programme

## Ball screws

- $d$  Reference diameter [mm]
- $d_0$  Nominal diameter [mm]
- $d_1$  Outside diameter [mm]
- $d_2$  Diameter at the thread root [mm]
- $P$  Pitch [mm]
- $L_{max}$  Maximum length of screw [mm]

### Rolled models (tolerance class 7) for the compact DIN Nut (Type SC/DC)

## Fixed bearing unit PBUF with angular contact ball bearing

The fixed bearing units consist of:

- Pillow block housing made of steel with stop edges on both sides, direct drive adaption and lubrication option
- Double row angular contact ball bearing with a contact angle of 58°
- Slotted nut with radial clamping
- Thread ring

Suitable for standard spindle ends type F3, F4 (see page 21)

### Floating bearing unit PBUL with deep grooved ball bearing DIN 625

The floating bearing unit consists of:

- Pillow block housing made of steel
- Deep grooved ball bearing DIN 62...-2RS
- Retaining ring DIN 471
- Cover

*Suitable for standard spindle ends type S2 (see page 22)*

# I Travel variation and travel deviation

The tolerance classes of the SNR ball screws are defined in accordance with ISO 3408. The tolerance classes T0-T5 are determined according to the mean travel variation and the tolerance of the travel deviations over the entire usable travel  $l_u$ . For tolerances T7-T10 the mean deviation over the length 300 mm is defined at anywhere over the length of thread.

- $l_u$  The usable travel is the stroke plus length of the ball nut.
- $l_e$  The overrun is the axial travel beyond the usable travel serving the safety purpose. The narrowed travel and hardness tolerances for the usable travel are not used.
- $l_0$  The nominal travel is the axial travel that results from the nominal pitch multiplied with the number of turns with the rotation of the ball nut relative to the ball screw spindle.
- $c$  Travel compensation over the usable travel. Difference between target and actual travel is defined by the user. (Standard  $c=0$ ).
- $e_p$  Upper and lower limit of the target travel form the tolerance fields for the mean travel.
- $v_{up}$  Tolerance of the travel variation above the usable travel  $l_u$ .
- $v_{300p}$  Tolerance of the travel deviation for a travel of 300 mm, anywhere over the length of thread.
- $v_{2\pi p}$  Tolerance of the travel deviation within one revolution.

Permissible variances of the intermediate travel variation and the travel fluctuation

# Functional tests according to ISO 3408-3

Measurement of the drag torque at preloading  $\Delta T_p$

## Drag torque through preloading $T_{pr}$

The torque at the ball screw that is required to turn the ball nut against ball screw (or vice versa) without external load. Possible friction torques due to the sealing elements are not considered.

## Total drag torque $T_t$

The torque that is required to turn the ball nut against ball screw (or vice versa) without external load, inclusive of the friction torques.

## Torque variation

Fluctuation value of the predefined drag torque under preload. A positive or negative value relative to the mean torque.

## Measuring method

Preloading generates a dynamic friction torque between the nut and the thread. This is measured by moving the threaded spindle at a constant speed, whilst the nut is held with a special locking device. The force  $F$  ( $F_t$ ) measured by the force transducer is used to calculate the friction torque of the threaded spindle.

# Axial clearance and preloading

Through the preloading the axial clearance of the ball screw is removed and the stiffness is increased. In addition the positional accuracy is also improved.

The preloading of the single nut is achieved by installing balls of selected dimensions.

The preloading of the double nut is created by tensioning two nuts against each other.

## Combination of axial clearance and preloading

Symbol	0	1	2	3	4

# Critical speed of ball screws

As with any rotating shaft, a ball screw has a critical speed, which is a harmonic vibration. Running the ballscrew in the critical speed area consistently will shorten its operational life, and could affect the performance of a machine as the vibration passes through the machine chassis. For example: On a machine tool it could cause flaws in the surface finish as ball screw reaches its critical speed, as the vibration is transmitted to other parts of the machine. The critical speed is a function of the diameter and length of the ball screw shaft, and the mounting configuration. The axial clearance of the nut has no influence on the critical speed  $n_k$ .

The operating speed should be kept at or below 80% of the critical speed. The formula below, for calculating the admissible speed  $n_{kzyl}$ , takes account of this 0.8 safety factor.

$$n_{kzyl} = \alpha * \frac{60 * \lambda^2}{2 * \pi * l_k^2} \sqrt{\frac{E * I * g}{\gamma * A}} = f * \frac{d_2}{l_k^2} * 10^7 \quad (1/\text{min})$$

The maximum permissible speed of the ball screw is limited by the DN value in addition to the critical speed.

For the nuts SC/DC

$$d_0 * n_{kzyl} \leq 120.000$$

For the nuts CI, SK, SU/DU, SE

$$d_0 * n_{kzyl} \leq 90.000$$

$d_0$  Centre diameter of the spindle, mm

Please contact our application engineers if the required speed exceeds the DN value, or the ball screw is used for higher speeds.

$n_k$	critical speed (r.p.m.)	
$n_{kzyl}$	permissible operating speed (r.p.m.)	
$\alpha$	safety factor (=0.8)	
$E$	elasticity modulus ( $E=2.06 \times 10^5$ N/mm <sup>2</sup> )	
$I$	geometric moment of inertia (mm <sup>2</sup> )	
$d_2$	diameter at the ball screw root (mm)	
$\gamma$	specific material density ( $7,6 \times 10^{-5}$ N/mm <sup>3</sup> )	
$g$	earth's gravitational constant ( $9,8 \times 10^3$ mm/s <sup>2</sup> )	
$A$	cross section of the ball screw (mm <sup>2</sup> )	
$l_k$	unsupported length between the two housings	
$f$	correction factor due to mounting	
supported-supported	$\lambda=3,14$	$f=9,7$
fixed-supported	$\lambda=3,927$	$f=15,1$
fixed-fixed	$\lambda=4,730$	$f=21,9$
fixed-floating	$\lambda=1,875$	$f=3,4$

# Permissible axial load for the screw (buckling)

Similar to any shaft, ball screws can only withstand a limited axial load. Any stress greater than the maximum defined values can lead to failure of the screw. The permissible axial compression is a function of the length, diameter and the type of mounting of the screw. The maximum axial compression load should be 50% or less of the theoretical permissible load. The calculation made using the formula below takes this safety factor into account.

- F<sub>k</sub> theoretical maximum permissible axial load (N)
- F<sub>kzyl</sub> maximum permissible working axial load (N)
- α safety factor (=0,5)
- E modulus of elasticity  
(E = 2,06 \* 10<sup>5</sup> N/mm<sup>2</sup>)

$$F_{kzyl} = \alpha * \frac{N * \pi^2 * E}{l_k} = m * \frac{d_2^4}{l_k} * 10^3 \text{ (N)}$$

- l geometric moment of inertia  
 $l = \frac{\pi}{64} * d_2 \text{ (mm}^4\text{)}$

- d<sub>2</sub> diameter at the ball screw root (mm)
- l<sub>k</sub> unsupported length between the two housings (mm)
- m, N factor linked to the
 

supported-supported	m=5,1	N=1
fixed-supported	m=10,2	N=2
fixed-fixed	m=20,3	N=4
fixed-floating	m=1,3	N=0,25

# Calculation basis

## Average speed and average load:

In the event of variable operating conditions (speed and load), the working life calculations will rely on the average values  $F_m$  and  $n_m$

For the average speed  $n_m$ , in the case of variable speed, apply

$$n_m = \frac{q_1}{100} \cdot n_1 + \frac{q_2}{100} \cdot n_2 + \dots + \frac{q_n}{100}$$

$n_m$  = average speed (r.p.m.)  
 $q$  = time (%)

For the average load  $F_m$ , in the case of a variable load, apply

$$F_m = \sqrt[3]{F_1^3 \cdot \frac{q_1}{100} + F_2^3 \cdot \frac{q_2}{100} + \dots + F_n^3 \cdot \frac{q_n}{100}}$$

$F_m$  = average load (kN)  
 $q$  = movement or time at constant speed (%)

For the average load  $F_m$ , in the case of both variable load and speed, apply

$$F_m = \sqrt[3]{F_1^3 \cdot \frac{n_1}{n_m} \cdot \frac{q_1}{100} + F_2^3 \cdot \frac{n_2}{n_m} \cdot \frac{q_2}{100} + \dots + F_n^3 \cdot \frac{n_n}{n_m} \cdot \frac{q_n}{100}}$$

$F_m$  = average load (kN)  
 $q$  = time (%)  
 $n_m$  = average speed (r.p.m.)

## Nominal working life

Working life  $L$ , expressed in revolutions

$$L = \left(\frac{C_a}{F_m}\right)^3 \cdot 10^6 \Rightarrow C_{a\min} = F_m \cdot \sqrt[3]{\frac{L}{10^6}}$$

$L$  = working life (in r.p.m.)  
 $F_m$  = average load (kN)  
 $C_a$  = dynamic load capacity (kN)

Working life, expressed in hours  $L_h$

$$L_h = \frac{L}{n_m \cdot 60 \cdot ED}$$

$L_h$  = working life (h)  
 $L$  = working life (in revolutions)  
 $n_m$  = average speed (r.p.m.)  
 $ED$  = operating time (%)

## Motor torque and output power

### Output torque $M_{ta}$

for the transformation of rotational movement into linear movement

$$M_{ta} = \frac{F \cdot P}{2 \cdot \pi \cdot \eta}$$

$M_{ta}$  = output torque (Nm)

$M_{te}$  = resistive torque (Nm)

$F$  = actual load (kN)

$P$  = pitch (mm)

$\eta$  = yield (approx. 0.9)

$\eta$  = yield (approx. 0.8)

### Resistive torque $M_{te}$

for the transformation of linear movement into rotational movement

$$M_{te} = \frac{F \cdot P \cdot \eta}{2 \cdot \pi}$$

For preloaded double nuts, take no-load torque into account.

### Output power $P_a$

$$P_a = \frac{M_{ta} \cdot n}{9550}$$

$P_a$  = output power (kW)

$M_{ta}$  = output torque (Nm)

$n$  = speed of rotation (1/min)

## Mounting the nut on the screw

In case of separate delivery of ball screws and ball nuts, qualified personnel must carry out the assembly of the ball screws. Ball nuts should be mounted only with the help of a fitting sleeve. The fitting sleeve delivered with the nut unit can be used. The start of the thread of the spindle must be aligned, so that the wiper and the internal single parts of the nut unit are not damaged.

As standard SNR ball screws are delivered with an installed nut unit. The nut unit and spindle should not be dismantled (especially applicable for a preloaded nut). If this is unavoidable, please contact our application engineers.

### Proceed with the mounting as follows:

Remove the rubber washer from one side of the sleeve. Push on the nut with the sleeve on the end of the screw. Press the sleeve against the start of the screw thread.

Screw the nut on to the thread, using a slight axial pressure. Then screw the nut on for its entire length.

Remove the mounting sleeve only when the nut is completely threaded on to the screw. Lock the nut to prevent any unscrewing (using a rubber washer or fixing the sleeve axially).

### What do I do when...

Balls escape while threading on the nut?

1. Pick up the balls (the nut is only compatible with the original balls). The load capacity is then ensured, even if two or three balls are missing.
2. Carefully clean all the components.
3. Use the sleeve as a mounting jig.
4. Replace the balls.
5. Start with the lowest circuit. Insert the balls into the nut circuit, the sleeve prevents the balls from falling inside.

### Note:

Ground ball screws, with a single or double nut are always delivered with the nut assembly mounted, similarly to rolled double nut screws.

Please contact us if you absolutely must dismantle a nut assembly.

### Important:

Use only the original balls!

### Important:

Do not place the balls in the empty circuit located between the two deflectors!

# Operating and maintenance information for the ball screws

## Operating conditions

In addition to the load rating, the maximum speed, critical bending speed and the permissible buckling force should also be considered. Ball screws are conceptualised as a drive element for creating axial feed force. Radial forces and torques that have an impact on the nut, lead to the reduction of durability. When using a ball screw the ambient temperature shall not exceed 80°C.

## Assembly

During assembly, parallel alignment of the guiding elements should be ensured. Special care must be taken to achieve a concentric assembly of the nut on the spindle. Here attention should be paid to the tolerance relationship between the guiding elements and layout as well as the bearing units and nut housings. By providing alignment options to the nut or to the bearing, good accuracy with lower cost can be realised.

## Lubrication

For maintaining the performance of a ball screw, it must be lubricated adequately. Similar lubricants that are used for rolling bearings should be used. Lubricants containing MoS<sub>2</sub> or graphite should not be used. The selection of the lubricant and the type of supply can be adjusted to match the lubrication of the other components of the machine. A one off lifetime lubrication of the ball screw is not adequate based on experience, as the spindle constantly discharges small amounts of lubricant from the nut.

**SNR – ball screws are supplied with the conserving oil “Contraktor Fluid H1”.** “Contraktor Fluid H1” is compatible with the SNR standard lubricant “SNR LUB Heavy Duty”.

The lubrication period is dependent on many factors such as:

- Load
- Speed
- Motion sequence
- Temperature

The following factors reduce the lubrication interval:

- Greater load
- High speed
- Short stroke (stroke is smaller than three times the length of the nut)
- Lower ageing resistance of the lubricant

### Grease lubrication

For operation under normal conditions, grease SNR Heavy Duty is used. Specific requirements under certain environmental conditions require the use of a suitable grease. In the food industry and clean room there are special requirements for the lubricant with regard to emission and compatibility. Basically the compatibility of the lubricants against each other should be checked. In case of special ambient conditions we will gladly assist you. Depending on the area of application the following lubricants can be used:

Name	Oil type, consistency	NLGI-class DIN 51818	Walk penetration DIN ISO 2137 at 25°C	Ground oil viscosity DIN51562 at 40°C	Density	Temperature range	Properties	Field of application
			[0,1 mm]	[mm²/s]	[kg/m³]	[°C]		
SNR LUB Heavy Duty	Paraffin mineral oil / Lithium – Special - Soap	2	285	ca. 105	890	-30...+110	Lower friction, smooth running	General engineering
SNR LUB GV+	Synthetic KW oil / ester oil / Lithium – Special - Soap	2	265...295	24	900	-50...+120	Very good adhesion, very good water resistance	High speeds
SNR LUB HIGH TEMP	Synthetic KW oil / mineral oil / polyurea	2	265...295	160	900	-40...+160	High temperature resistance, good corrosion protection, high oxidation resistance	High temperature range
SNR LUB FOOD	Paraffin mineral oil / aluminium complex soap	2	265...295	ca. 240	920	-30...+110	Good corrosion protection, very good adhesion, high water resistance, NSF H1 registered*	Food industry
Microlub GL261	Mineral oil / Lithium – Special - Soap	1	310...340	280	890	-30...+140	Good wear protection, special pressure resistance additive against tribo corrosion	general engineering high load short-stroke applications, vibrations
Klübersynth BEM34-32	Synthetic CW - oil / special - calcium soap	2	265...295	ca. 30	890	-30...+140	Particularly pressure resistant, good wear protection, good ageing resistance low starting torque	Clean-room applications
Klübersynth UH1 14-151	Synthetic CW oil/ester oil / aluminium complex soap	1	310...340	ca. 150	920	-45...+120	Good corrosion protection, good ageing resistance, high water resistance, NSF H1 registered*	Pharmaceutical industry Food industry

*\* This grease is registered as H1 product: it has been developed for occasional, technically unavoidable contact with foodstuff. Experiences have shown that the grease can also be used for the corresponding applications in the pharmaceutical and cosmetic industry, on the conditions listed in the product information. However, there are no specific test results, for instance, on the biocompatibility, as may be required under certain circumstances in the pharmaceutical area. Therefore, before it is used in this area by equipment manufacturers and distributors, corresponding risk analyses must be performed. If necessary, measures to avoid health hazard and injuries must be taken. Source: Klüber Lubrication)*

At higher speeds (speed parameter  $DN > 50,000$ ) the quality K1K or KP1K should be selected. Speed parameters under 2,000 require a grease of the consistency class 3 (K3K or KP3K DIN 51825). The required lubrication period is based on the ambient conditions. In general re-lubrication should be carried out every 200-600 operating hours. The following is applicable as a reference value for the lubricant quantity: Per cm spindle diameter  $\geq 1$  cm<sup>3</sup> grease for each nut. Only greases of same soap base should be used for lubrication.

### Oil lubrication

As a rule, oil lubrication is used in conjunction with centralised lubrication equipment. The advantage of centralised automatic oil lubrication is a continuous lubricant supply to all the lubrication points. Lubricant oils ensure a very good dissipation of friction heat. In contrast there are higher design and assembly requirements for the lubrication lines. Depending on the area of application the following lubricant oils can be used:

Name	Type of lubricant	Kinematic viscosity DIN51562 at 40°C	Density	Temperature range	Properties	Field of application
		[mm <sup>2</sup> /s]	[g/cm <sup>3</sup> ]	[°C]		
Klüberoil GEM 1-100N	Mineral oil	100	880	-5....+100	Good corrosion and wear protection	General engineering
Klüberoil 4 UH1-68N	Polyalphaolefin	680	860	-25....+120	good ageing and wear protection	Food industry
					NSF H1 registered*	Pharmaceutical industry

*\* This grease is registered as H1 product: it has been developed for occasional, technically unavoidable contact with foodstuff. Experiences have shown that the grease can also be used for the corresponding applications in the pharmaceutical and cosmetic industry, on the conditions listed in the product information. However, there are no specific test results, for instance, on the biocompatibility, as may be required under certain circumstances in the pharmaceutical area. Therefore, before it is used in this area by equipment manufacturers and distributors, corresponding risk analyses must be performed. If necessary, measures to avoid health hazard and injuries must be taken. Source: Klüber Lubrication)*

At higher speeds (speed parameter  $DN > 50,000$ ) oils of the viscosity class ISO VG 46-22 should be used. For speed parameters under 2,000 the viscosity ISO VG 150-460 should be used. If the load is above 10% of the dynamic load rating, an oil with additives is recommended for increasing the load capacity (class CLP, DIN 51517 Part 3). With oil bath lubrication the spindle must be 0.5 to 1 mm above the oil level. The oil supply with re-circulation lubrication should be 3 cm<sup>3</sup>/h for each ball circulation.

## (4) Direction of pitch

R right  
 L left

## (5) Type of nut

CI Single cylindrical nut (Page 7)  
 SK Single flanged miniature nut (Page 6)  
 SE Single flanged nut (wide pitch) (Page 12)  
 SC Single flanged compact nut to DIN 69051 (Page 8)  
 DC Double flanged compact nut to DIN 69051 (Page 9)  
 SU Single flanged nut to DIN 69051 (Page 10)  
 DU Double flanged nut to DIN 69051 (Page 11)  
 SH Single threaded nut (Page 13)

For the coding of screws alone:

01 Screw for compact series DIN nut  
 00 Screw for special nut types

## (6) Number of circuits

## (7) Type of flange

A DIN 69051 section 5 form A (round)  
 B DIN 69051 section 5 form B  
 C DIN 69051 section 5 form C  
 Z Cylindrical nut

## (8) Precision class (Page 22)

T0, T1, T2, T3, T5, T7 (in stock), T10

## (9) Model

G ground  
 R rolled

## (10) Preload types (Page 26)

0 Standard axial clearance  
 1 No axial clearance  
 2 Light preload  
 3 Medium preload  
 4 High preload

## (11) Total length (mm)

## (12) Right side screw end (Pages 19-20)

F, S Form F, S (X depending on customer drawing, 0 with no end machining)  
 1, 2 Model  
 6...60 Diameter of the bearing seat

## (13) Left side screw end, see right side screw end

## (14) Lubrication

0 Standard nut greasing  
 1 Anti-corrosion greasing  
 2 Greasing to customer instructions

## (15) Special

0 None  
 1 Taking account of drive torque measurement  
 2 Taking account of pitch error

Company \_\_\_\_\_

Address \_\_\_\_\_ Contact \_\_\_\_\_

Position \_\_\_\_\_ Telephone \_\_\_\_\_ Fax \_\_\_\_\_

Description of the application \_\_\_\_\_

<input type="checkbox"/> Isolated need	No. of pieces	<input type="checkbox"/> New construction
<input type="checkbox"/> Production need	Required delivery _____ Weeks	<input type="checkbox"/> Technical improvement
	Pieces per year _____	<input type="checkbox"/> Cost reduction / Current price _____ €
	Delivery of _____ pieces required in _____ Weeks	

### Application parameters

Type of mounting: <input type="checkbox"/> Horizontal <input type="checkbox"/> Vertical	Usable stroke: _____
Maximum usable load: _____ kg	Additional axial load: _____
Maximum movement speed: _____ m/s	Maximum acceleration: _____
Positioning accuracy: _____ mm	Reproducibility: _____ mm
Maximum inversion clearance: _____ mm	Cycle time: _____ sec
Required working life _____ strokes or _____ hours	

Ambient conditions of use: \_\_\_\_\_

Special circumstances: \_\_\_\_\_

### Dimensions and features, if existing application

<input type="checkbox"/> Flange nut:	Maximum dimensions of the nut: _____
<input type="checkbox"/> Cylindrical nut	Nominal screw diameter: _____ mm
<input type="checkbox"/> DIN nut	Pitch: _____ mm
	Total length: _____ mm

### Housings

<table border="0"> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>fixed</td> <td>supported</td> <td>supported</td> <td>floating</td> </tr> </table>					fixed	supported	supported	floating	<input type="checkbox"/> With machining of the ends to drawing no. <input type="checkbox"/> Machining of the ends for use with SNR housings
fixed	supported	supported	floating						
<table border="0"> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td>fixed</td> <td>fixed</td> <td>supported</td> <td>fixed</td> </tr> </table>					fixed	fixed	supported	fixed	<input type="checkbox"/> No end machining
fixed	fixed	supported	fixed						

The consultation of SNR WÄLZLAGER GMBH is exclusive for the function of the ball screws. As a supplier of a component SNR accepts no liability for the function, operation or performance for the machine, system or assembly to which the ball screw is mounted. This responsibility lies with the machine designer, manufacturer, operator or other relevant parties.

More information concerning our NTN-SNR products for linear motion is provided in our catalogues.
